

Healthcare

How can a console make the most of your radio system?

- **Two-way radio systems** facilitate communications among hospital staff, ambulance personnel and other urgent-care facilities.
 - ER Communications with ambulance, medical evacuation helicopters, other agencies when assistance in transportation is required.
 - Consoles can have different city agencies and phone systems to patch to the hospital radio systems.
 - Some hospitals have transportation provided for employees from parking to hospital working location.
- **Paging systems** are used to notify doctors and nurses, emergency response teams and other hospital staff.
- **Remote-monitoring-and-control systems** notify personnel of building security issues, maintenance problems and critical equipment malfunctions. These alerts can be set up to go through the console or pre-programmed conditions can be transmitted to handheld portables and mobile radios.
- **Alarm monitoring and control systems** provide added protection of the facilities with around-the-clock surveillance, alarm reporting and automated control.
